CPD accredited training

Sensium have made a significant investment in the quality and consistency of our end user training and have developed exceptional training programmes that are delivered by our Sensium Clinical Training Team. The key features of the training programs are:

- CPD Accredited
- Competency based bite sized modules
- 3 modules to choose from suitable to job role
- Up to 100 hours of CPD training for new installations
- Staff remain on the ward - no need for back fill
- Training delivered by RGNs
- Tailored program delivery to suit shift patterns
- Potential for significant saving from training budgets

The quality of the training programmes have been recognised by the awarding of CPD accreditation. Our training programs are delivered on the ward by RGNs and prior to installation a training plan for your staff will be developed with you and tailored to fit around your shift patterns.

Sensium®

SUPPORT TO ENABLE CLINICAL CHANGE

Experience of introducing clinical change

Track record of successful clinical and technical deployment

CPD accredited training

Delivers value to the hospital and staff

On-going performance analysis

Data to demonstrate tangible benefits

“Sensium have supported us every step of the way from initial discussions to full clinical deployment. The Clinical Team worked with us to develop a new standard operating procedure to ensure that the Sensium technology is truly embedded into our clinical work flow.”

Phase 1

Clinical and technical pre-assessment

This phase is designed to ensure that Sensium have a thorough understanding of your clinical and technical requirements to guarantee successful planning and implementation of the new clinical work flow.

The Sensium Clinical Team will be on-site to conduct a clinical assessment of the ward area, considering aspects such as the population that will be patched, ward operation, job roles and equipment required. The team will take this opportunity to assess the current patient flow, potential bottle necks and pain points. The Sensium Technical Services Team will perform assessments designed to ensure that the technical set-up of the ward is appropriate and will deliver smooth performance for clinical staff. This will include a radio frequency (RF) survey to determine the extent of RF interference and review of Wi-Fi coverage to check that there is sufficient coverage for use of Sensium apps. If any issues are discovered, Sensium will work with you to resolve them. The results of these surveys will ensure that the correct equipment is ordered and installed to ensure seamless running of the system.

Phase 3

Testing, Training and launch

In this phase the clinical setting is prepared for a successful launch of the new work flow. The Sensium Technical Team will be on-site, conducting testing to ensure everything is running smoothly before launch.

Once testing is complete, the Sensium Clinical Team (RGNs) will schedule and deliver CPD accredited training on the ward with all relevant clinical staff, including Super User training for select individuals. A dedicated online training portal will be used to assess knowledge of training and highlight any areas which may require further support. CPD certificates will be issued to all staff who complete training.

When the site is ready for launch, the Sensium team will be on-hand to support the new clinical work flow.

Phase 2

Installation and procedures

In this phase, Sensium will utilise years of experience supporting clinical change to plan and execute the system installation as well as the development of new standard operating procedures (SOPs).

The Sensium Clinical Team will work with you to support the development of new standard SOPs. SOPs will help to ensure that all clinical staff understand how to respond to the Sensium technology (for example how they should respond notifications of high or low vital signs). A clear and well understood SOP will ensure all staff know their role with the new clinical work flow. A training plan for your staff will be designed and tailored to fit around your shift patterns. Sensium use remote access to execute the majority of the technical setup. The Technical Team will work with your IT Department to ensure server provisioning, ADT set-up, EMR integration, networking, app and active directory set-up run smoothly.

Phase 4

Performance analysis

This on-going phase is designed to validate the solutions effectiveness and ensure benefits are being realised. It will also ensure that the latest system is installed and user training is up to date.

Sensium will work with you to collect anonymous patient data and provide reports for assessment of value, e.g. percentage of valid vitals, notification and responses. Based on findings, Sensium will make recommendations to resolve any obstacles to clinical adoption. Relevant system updates will be installed and re-fresher training provided when required. Sensium will continue to provide technical and clinical support for as long as it takes for the system to be truly embedded in the clinical work flow and providing tangible benefits.
